CSSE376 Lab 7

1. It's powerful since it allows you to quickly run through the functionality of a website using a browser and making sure it works. Since the process is automated and repeatable, it allows a developer to cover much more in a shorter amount of time.
2. It's finicky beyond all reason. To illustrate, I ran it once and it hit an error and then I ran it again only for it work without me making any changes. It has shown very little consistency.
3. <tr><td>MyCase</td></tr>
4. <tr><td>Click</td><td>//a[@id='myLink']/</td></tr>
5. Using HTML allows the test code to mesh much more freely with the actual code that makes up the website as opposed to forcing two unrelated languages together. However, it also limits what all you can do since HTML is a very limited language.
